## ACKNOWLEDGEMENT

We thank God for his unstoppable blessings and also for giving as good

knowledge and strength in enabling us to finish our project. Our deep gratitude goes to our founder late **Dr. D. SELVARAJ, M.A., M.Phil.**, for his patronage in the completion of our project. We like to take this opportunity to thank our honourable chairperson **Dr.S. NALINI SELVARAJ, M.COM., MPhil., Ph.D.**

and honourable director, **MR.S. AMIRTHARAJ, M.Tech., M.B.A** for their

support given to us to finish our project successfully. We wish to express our

sincere thanks to our beloved principal. **Dr.T.JOHN ORAL BASKAR., M.E.,**

**Ph.D** for his kind encouragement and his interest towards us.

We are extremely grateful and thanks to our professor

**Dr.G.MANIKANDAN**, head of Information Technology, Kings Engineering

College, for his valuable suggestion, guidance and encouragement and to our SPOC **DR. MRS. PARAMASHWARI**, head of Artificial Intelligence and Data Science. We wish to express our sense of gratitude to our project supervisor **Dr. J Briso Becky Bell**, Assistant Professor of Information Technology Department, Kings Engineering College and project evaluator **Mr. B. MUTHAZAGHAN**, Associate Professor of Information Technology Department, Kings Engineering College whose idea and direction made our project a grand success, also our Industrial Mentor **KRISHNA CHAITANYA**. We express our sincere thanks to our parents, friends and staff members who have helped and encouraged us during the entire course of completing this project work successfully.

## 1. INTRODUCTION

The fast growth of the Internet caused a matching growth of the amount of available online information that increased the need to expand the ability of users to manage all this information.

This encourages a substantial interest in specific research fields and technologies that could benefit the managing of this information overload. The most important fields are

Information retrieval and Information filtering. Information retrieval deals with automatically matching user's information and Information filtering aims to assist users eliminating unwanted information (Hanani et al., 2001). The latest technology designed to fight information overload is the recommender systems that originated from cognitive science, approximation theory, information retrieval, forecasting theories and also related to management science and to consumer choice modeling in marketing (Adomavicius and Tuzhilin, 2005). The recommender systems used to determine the interested items for a specific user by employing a variety of information resources that is related to users and items.

(Adomavicius and Tuzhilin, 2005).

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

## 1.1. PROJECT OVERVIEW

In the mid-1990s, the term recommender system was published for the first time in information system literature (Resnick and Varian, 1997). Many researches in industry and academic areas have been known to develop new approaches for recommender systems in the last decade. The interest in this area still remains high because it is composed of a problem-rich research area and has a wealth of practical applications (Adomavicius and Tuzhilin, 2005). Recommender systems are being broadly accepted in various applications to suggest products, services, and information items to latent customers. Many e-commerce applications join recommender systems in order to expand customer services, increase selling rates

and decrease customers search time (Schafer et al., 1999). For example, a wide range of companies such as the online book retailer Amazon.com (Linden et al., 2003), books (Mooney and Roy, 2000), and news articles (Das et al., 2007). Additionally, Microsoft provides users many recommendations such as the free download products, bug fixes and so forth (Shani and

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

Gunawardana, 2011). All these companies have successfully set up commercial recommender systems and have increased web sales and improved customer fidelity. Moreover, many software developers provide stand-alone generic recommendation technologies. The top providers include Net Perceptions, Epiphany, Art Technology Group, Broad Vision, and Blue Martini Software (Huang et al., 2007). For many years, information system supports in human resource management have been mainly restricted in storing and tracking applicants' data through the applicant management systems. These systems support the internal workflows and communication processes between the human resource management department and the other departments. Recently, the increased amount of digital information and the emergence of e-business reform the way companies conduct business in different aspects. Initially, simple solutions are applied such as posting the job ads on the career unit of the corporate website. Then, based on the experiences gained from these first implementations, the opportunities are realized, establishing other changes and hence, implementing enhanced e-recruitment platforms. The

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

Internet-based online recruiting platform or e-recruitment platform is one of the most successful business changes, which changed the way companies employ candidates. These platforms spread in the recent years because the recruiting of the appropriate person is a challenge faced by most companies, as well as the unavailability of certain candidates in some skill areas has long been identified as a major obstacle to companies success (Laumer and Eckhardt, 2010). The online channels like Internet job portal, social media applications or a firm's career website have driven this development. While the companies established job positions on these portals, job-seeker uses them to publish their profiles. For each posted job, thousands of resumes are received by companies. Consequently, a huge volume of job descriptions and candidate resumes are becoming available online. This vast volume of information gives a great opportunity for enhancing the matching quality; this potential is unused since search functionality in recruiting applications is mainly restricted to Boolean search method. The need increases for applying the recommender system

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

technologies that can help recruiters to handle this information efficiently (Färber et al., 2003; Yi et al., 2007).

## 1.2 PURPOSE

The significance of Information System (IS) support in the recruitment process can be observed when considering the phases of the recruitment such as the handling of candidates' applications and the pre-selection of candidates. However, a best fit between job and candidates depends on underlying aspects that are hard to measure. These underlying aspects are a significant reason why information systems have not been extensively used in the area of personnel selection so far.

Mostly, IS technology is used to pre-select applicants based on Boolean search method. This method used queries contain a combination of key words that define skill requirements in order to determine those candidates that match with search criteria. Such type of skill matching is applied in numerous e-recruiting

applications. However, as mentioned above, the simple filter techniques such as Boolean search method cannot be sufficient

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

to realize the complexity of a person-job fit as selection decisions often depend on underlying attributes such as personal characteristics or social skills that cannot be put into an operational way easily (Malinowski et al., 2006). Additionally, the need to understand the job requirements, in terms of the skills that are mandatory and those that are optional but preferable, the experience criteria if any, preference for the location of the candidate etc. Consequently, the major challenge faced e-recruiting applications as identified by the literature analysis is the large number of low qualification of applicants that match the search criteria (Singh et al., 2010). The recommender systems techniques can be used to address the problem of information overload by prioritize the delivery of information for individual users based on their learned preferences (Lee and Brusilovsky, 2007). Additionally, the success of personalization technologies depends critically on the existence of comprehensive user profiles that precisely capture users' interests (Rafter and Smyth, 2001) and the perfect matching method. Moreover, the recommender systems could use historical rating information to determine which type

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

of job required which type of candidate characteristics in the past in order to be rated positively by the recruiter. This information could then be used to predict the match between job and previously not rated candidates.

## **2. LITERATURE SURVEY**

### **2.1 EXISTING PROBLEM**

Having lots of skills but wondering which job will best suit you? Don't need to worry! We have come up with a skill recommender solution through which the fresher or the skilled person can log in and find the jobs by using the search option or they can directly interact with the chatbot and get their dream job.

## 2.3 PROBLEM STATEMENT DEFINITION

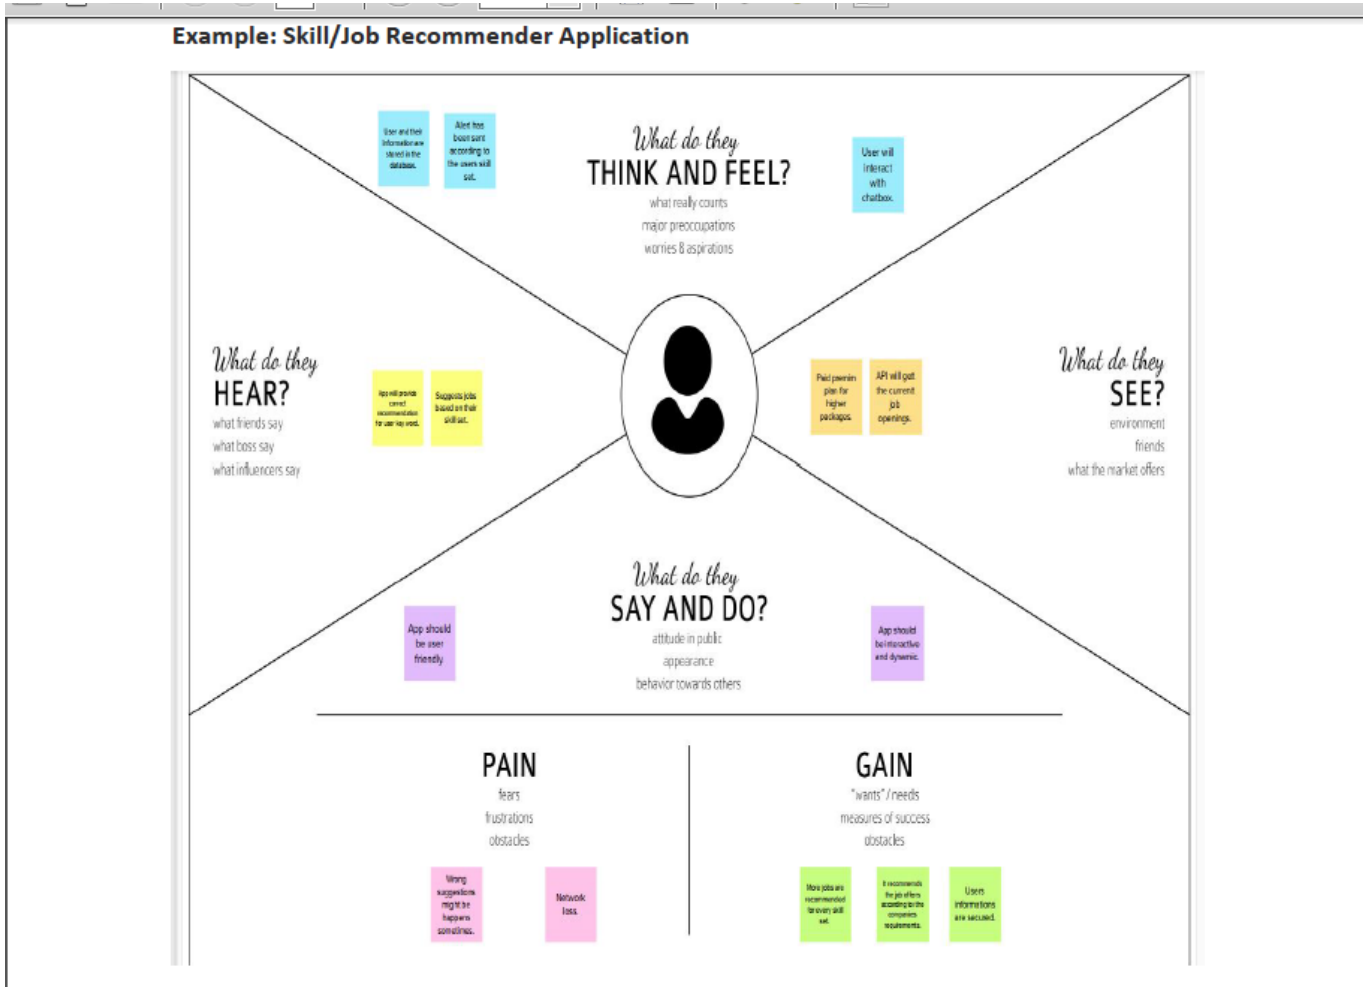

To develop an end-to-end web application capable of displaying the current job openings based on the user skillset. The user and their information are stored in the Database. An alert is sent when there is an opening based on the user skillset. Users will interact with the chatbot and can get the recommendations based on their skills. We can use a job search API to get the current job openings in the market which will fetch the data directly from the webpage.

## 3. IDEATION & PROPOSED SOLUTION

### 3.1 EMPATHY MAP CANVAS

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

**3.2 IDEATION AND BRAINSTORMING**

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

## Brainstorm & idea prioritization

Use this template in your own brainstorming sessions as your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

4 minutes to prepare

10 minutes to brainstorm

15 minutes to summarize

Before you collaborate

A little bit of preparation goes a long way and this section helps you get started on your journey.

4 minutes

Define your problem statement

We're problem-solving to solve. Frame your problem as a How Might We statement. This will help focus the ideas of your brainstorm.

5 minutes

Brainstorm

Write down any ideas that come to mind, then address your problem statement.

10 minutes

Group ideas

Take 5 minutes to group ideas and clustering similar ideas into categories. Group ideas that are similar, group ideas that are different. This will help you see the big picture and identify the most important ideas.

5 minutes

Finalize

Now that you have a clear idea of what you want to solve, it's time to start brainstorming ideas. This will help you see the big picture and identify the most important ideas.

10 minutes

After you collaborate

Now that you have a clear idea of what you want to solve, it's time to start brainstorming ideas. This will help you see the big picture and identify the most important ideas.

10 minutes

Group ideas

Now that you have a clear idea of what you want to solve, it's time to start brainstorming ideas. This will help you see the big picture and identify the most important ideas.

10 minutes

Finalize

Now that you have a clear idea of what you want to solve, it's time to start brainstorming ideas. This will help you see the big picture and identify the most important ideas.

10 minutes

--	--	--

### 3.3 PROPOSED SOLUTION

#### Description

##### 1.Problem Statement (Problem to be solved)

There may be a massive collection of job openings in various websites and might not provide the accurate information about current job openings and skill based recommendations.Having lots of skills but wondering which job suits as per your skills.

##### 2.Idea / Solution description

This application will give accurate results as possible and provides instant solution for the customer problems in addition to that , customers can interact

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

with the chatbot which gives relevant solution to the customer problems

Furthermore, this skill/job recommender application provides up to date

information of job openings of the firms.

### 3. Novelty / Uniqueness

Our uniqueness is all users can find the jobs according to their skills sets which may have any kind of qualifications. Customers will be treated same for every skills there is no partiality by their skills or qualifications , jobs according to their every kind of skills will be recommended by our app. And also we don't have any premium or subscription plans in our app it is same for all the users.

### 4. Social Impact / Customer Satisfaction

After launching of this application many peoples burden will reduce to seek job according to their skills. This will create huge benefit for customers to find the correct job which also suits for their skill sets and also according to their interests.

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

## 5.Business Model (Revenue Model)

The Internet-based recruiting platforms become a primary recruitment channel in most companies. While such platforms decrease the recruitment time and advertisement cost, they suffer from an inappropriateness of traditional information retrieval techniques like the Boolean search methods.

Consequently, a vast amount of candidates missed the opportunity of recruiting. The recommender system

technology aims to help users in finding items that match their personnel interests; it has a successful usage in e-commerce applications to deal with problems related to information overload efficiently. In order to improve the e-recruiting functionality, many recommender system approaches have been proposed.

## 6.Scalability of the Solution

- Our application takes less time to respond.
- Our application will response many requests simultaneously without making any server crashes.

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

- So this will ensure our application will scalable.

**3.4 PROBLEM SOLUTION FIT**

	PAGE \* MERGEFORMAT 1

4.REQUIREMENT ANALYSIS

4.1 FUNCTIONAL REQUIREMENT

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

FR-1 User Registration Registration through Form Registration  
through Gmail Registration through LinkedIn

FR-2 User Confirmation Confirmation via Email Confirmation  
via OTP

FR-3 User login User should login the with the user name and  
password

FR-4 User installation User can install the app from Google  
play store or Apple store or directly from the website.

## **NON-FUNCTIONAL REQUIREMENT**

NFR-1 Usability Everyone can easily install and use from the  
play store by using the instructions in the app.

NFR-2 Security The application is very secure and confidential.

NFR-3 Performance The app can work fast and more reliable.

NFR-4 Availability It is available in all kind of play stores and  
more categories and jobs are recommended.

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

NFR-5 Scalability Our application takes less time to response many requests simultaneously without making any server crashes,so this will ensure our application will scalable.

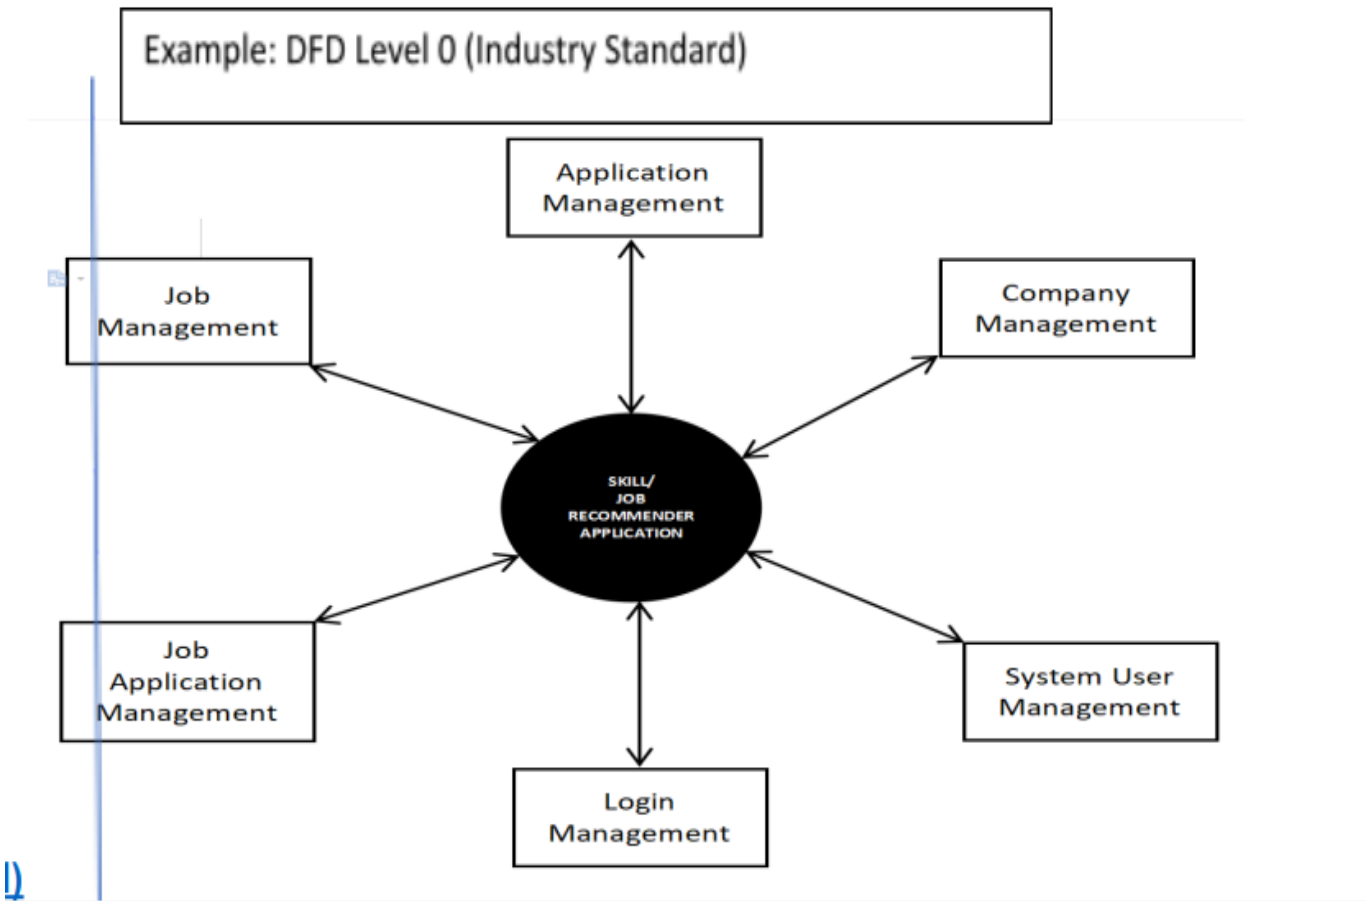

## 5.PROJECT DESIGN

### 5.1 DATA FLOW DIAGRAM

Data Flow Diagrams: A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

	PAGE \* MERGEFORMAT 1

## 8. TESTING

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

## 8.1 TEST CASES

- Logged in and verified
- Storing web pages(web app)
- Sent grid app is tested for response
- Data access rate is calculated in DB2
- DB connection is ensured
- Cluster is generated as multiple copies
- Submitting the required details
- Submitting the employee details

## 8.2 USER ACCEPTANCE TESTING

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal
By Design	10	4	2	3	20
Duplicate	1	0	3	0	4
External	2	3	0	1	6
Fixed	11	2	4	20	37
Not Reproduced	0	0	1	0	1
Skipped	0	0	1	1	2
Won't Fix	0	5	2	1	8
Totals	24	14	13	26	77

	PAGE \* MERGEFORMAT 1

### 3. Test Case Analysis

This report shows the number of test cases that have passed, failed, and untested

Section	Total Cases	Not Tested	Fail	Pass
Print Engine	7	0	0	7
Client Application	51	0	0	51
Security	2	0	0	2
Outsource Shipping	3	0	0	3

Exception Reporting	8	0	0	9
Final Report Output	5	0	0	4
Version Control	2	0	0	2

## 9. RESULTS

### 9.1 PERFORMANCE METRICS

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

- Bidirectional recommendation.
- Effective matching methods.
- Includes many attributes.
- Relational aspects are included.
- Qualitative and quantity representation (proficiency level for skills is included).
- Use two levels in skills matching (constraints and preferences).
- Use many attributes.
- Relational aspects are included.
- Effective matching methods.
- Use linguistic variables to determine skill levels.
- Use many attributes.
- Various information retrieval techniques are used.
- Constraints used to eliminate candidates before ranking

## DISADVANTAGES

- Binary representation only.
- Less attributes used.
- No perfect measures.

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

- Key words search method.
- One way recommendation.
- Knowledge acquisition and knowledge engineering problems.
- No relational aspects are included
- Knowledge acquisition and Knowledge engineering problems.
- Tools and technologies skills excluded
- One way recommendation.
- One way recommendation.
- No relational aspects are included.
- Scalability, ramp-up, and data sparsity problems.

## 11.CONCLUSION

In this paper, Content-Based Filtering and Collaborative Filtering of recommendations have been compared.

Additionally,an aggregation plus recommender system has been devised. Content-Based Filtering recommends the results based

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

on matching the personal preferences of the user with the given document whereas collaborative filtering recommends based on the preferences of fellow users. On evaluating both of these methods, it was concluded that a hybrid system of both of these overcomes the limitations of both of them and increases the efficiency of ranking. Problems of cold start, sparse database, scalability, and lack of trend recommendation [5] have been eliminated. The proposal is to design a Job Recommender system that prioritizes quality over quantity. While there are websites and job listing portals already recommending jobs to job seekers based on their profiles, this research on aggregate quality recommendations has been achieved by crawling selectively, overcoming the limitations of [1, 4, 14]. A fully functioning user interface was developed to combine everything together to give the user a seamless experience.

## 12. FUTURE SCOPE

	PAGE \* MERGEFORMAT 1	
--	-----------------------	--

--	--	--

For this system to be hybrid, content-based filtering is required, which can only recommend jobs based on the user's current profile. It cannot deliver anything surprising based on the user's past searches. This paper also uses collaborative filtering which faces well-known problems of privacy breaches and cold start. The system has a broad scope that can be used to make it more robust and foolproof. Firstly, automating the crawling process is required, when a new company is added to the database. In other words, removing the one-time configuration step/process to fetch jobs of a particular new company can be done. These models can implement techniques such as KNN in collaborative filtering.

Implementing NLP in content-based filtering for better and more accurate search matching can be done. Along with this, testing and collecting more user data for better performance of the collaborative filtering module is required. Lastly, improving the cleansing process of the job description and using natural language processing are required. While using collaborative filtering, this work can be improved by giving different weights to different users based on their LinkedIn skills.
